

# Vectors and Scalars

- Many quantities in physics, like velocity, have a *magnitude and a direction*. Such quantities are called **VECTORS**.
  - Other quantities which are vectors: acceleration, force, ...
- Many quantities in physics, like speed, have a *magnitude only*. Such quantities are called **SCALARS**.
  - Other quantities which are scalars: temperature, mass, volume, ...

# Vector & Scalar Quantities

- *Vector*  $\equiv$  Quantity with **magnitude & direction**.
- *Scalar*  $\equiv$  Quantity with **magnitude only**.

## Equality of Two Vectors

- Consider 2 vectors, **A** & **B**  
**A = B** means **A** & **B** have  
the same **magnitude & direction**.

# Graphical Method of Adding Vectors

## “Recipe”

- Draw the 1<sup>st</sup> vector.
- Draw the 2<sup>nd</sup> vector starting at the tip of the first vector
- Continue to draw vectors “tip-to-tail”
- The sum is drawn from the tail of the first vector to the tip of the last vector

## Example:

$$\vec{A} + \vec{B} = \vec{C}$$

These are the same vector  $\vec{B}$  even though they are drawn at different locations.

The dashed versions of  $\vec{B}$  and  $\vec{A}$  show that  $\vec{A} + \vec{B} = \vec{B} + \vec{A}$ .

For vector addition the order does not matter.

## “Tail to Tip” Method.

Consider  $\mathbf{R} = \mathbf{A} + \mathbf{B}$  (See figure!).

### Graphical Addition Recipe

1. Draw  $\mathbf{A}$  &  $\mathbf{B}$  to scale.
2. Place the tail of  $\mathbf{B}$  at the tip of  $\mathbf{A}$
3. Draw an arrow from the tail of  $\mathbf{A}$  to the tip of  $\mathbf{B}$

4. *This arrow is the Resultant R*

Measure its length & angle with the  $\mathbf{x}$ -axis.

# Graphical Method of Vector Addition

- Adding (3 or more) vectors:

$$\mathbf{V} = \mathbf{V}_1 + \mathbf{V}_2 + \mathbf{V}_3$$

- Even if the vectors are not at right angles, they can be added graphically with the tail-to-tip method.

# Subtraction of Vectors

- First, **Define The Negative of a Vector:**
  - $\mathbf{V}$   $\equiv$  vector with the same magnitude (size) as  $\mathbf{V}$  but with opposite direction.

**Math:**  $\mathbf{V} + (-\mathbf{V}) \equiv \mathbf{0}$

- Then add the negative vector.
- For 2 vectors,  $\mathbf{V}_1$  &  $\mathbf{V}_2$ :

$$\vec{V}_2 - \vec{V}_1 = \vec{V}_2 + (-\vec{V}_1).$$

# Subtracting Vectors

- To subtract one vector from another, add the first vector to the negative of the 2<sup>nd</sup> vector, as in the figure below:

# Multiplication by a Scalar

- A vector  $\mathbf{V}$  can be multiplied by a scalar  $\mathbf{c}$

$$\mathbf{V}' = \mathbf{cV}$$

$\mathbf{V}' \equiv$  vector with magnitude  $\mathbf{cV}$  & same direction as  $\mathbf{V}$ .

- If  $\mathbf{c}$  is negative, the resultant is in the opposite direction.
